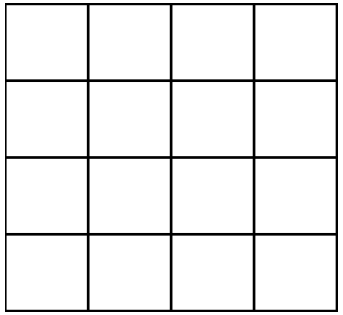
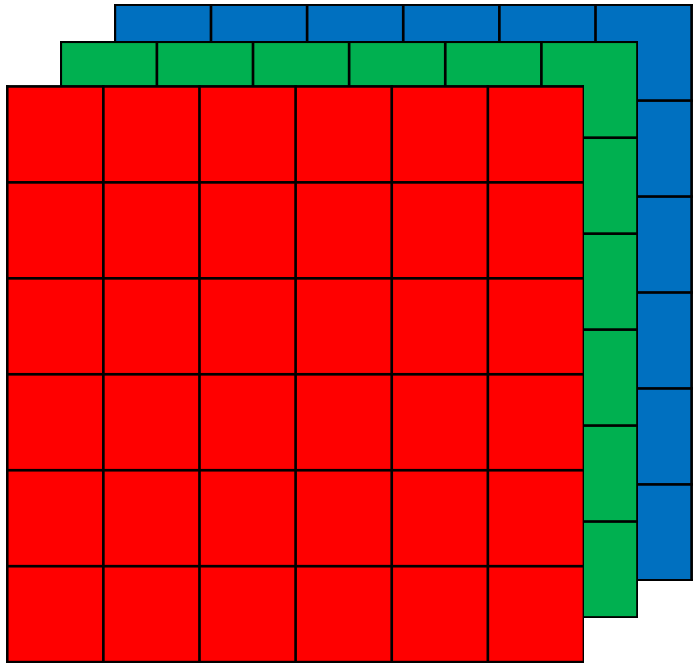
3x3x3

=



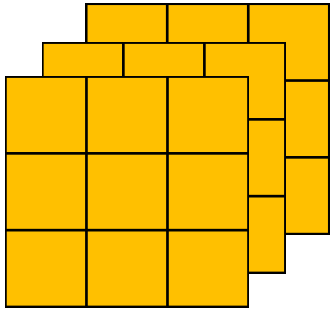
4 x 4

Multiple filters



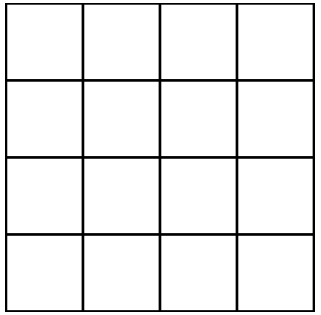
6 x 6 x 3

*



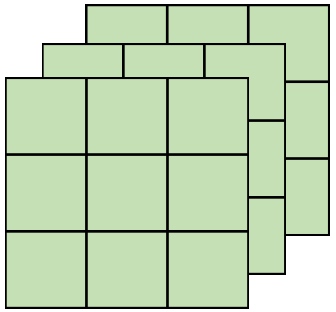
3 x 3 x 3

=



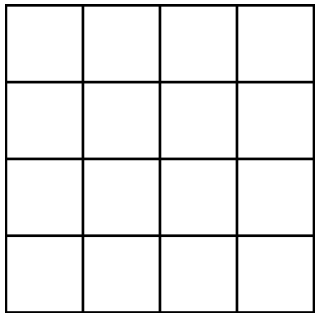
4 x 4

*



3 x 3 x 3

=



4 x 4

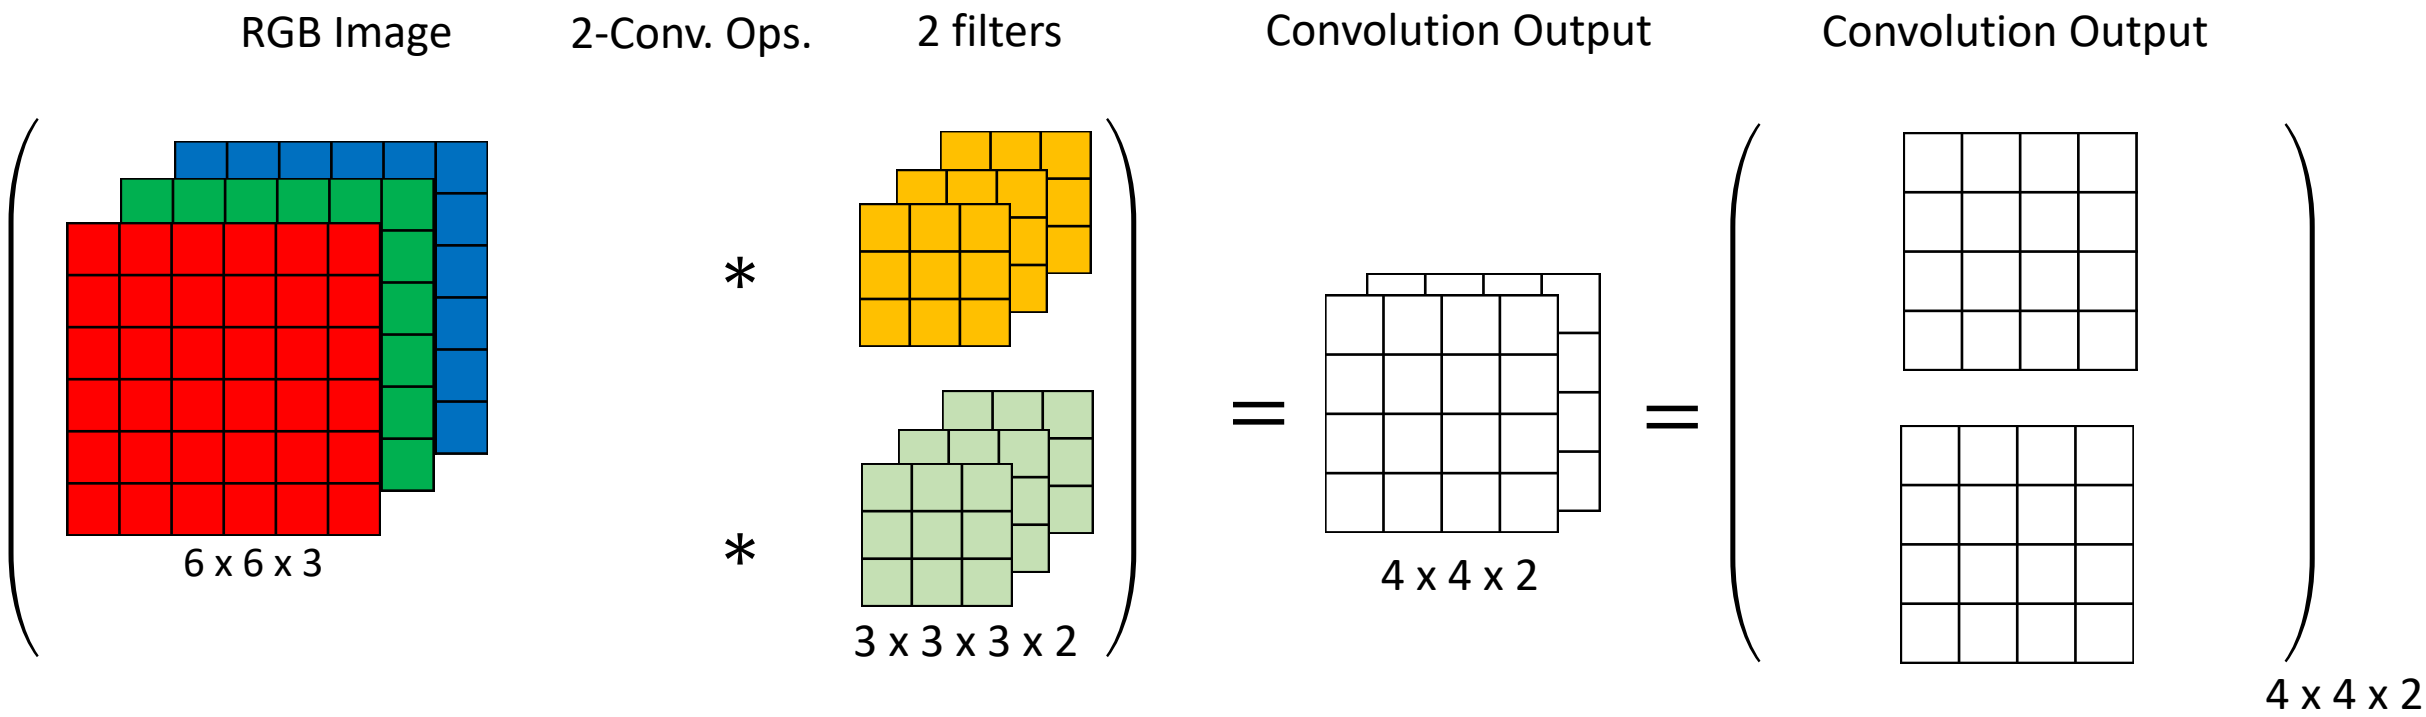
Number of channels

$n \times n \times n_c$ * $f \times f \times n_c \times 2$ = $(n- f +1) \times (n-f+1) \times 2$

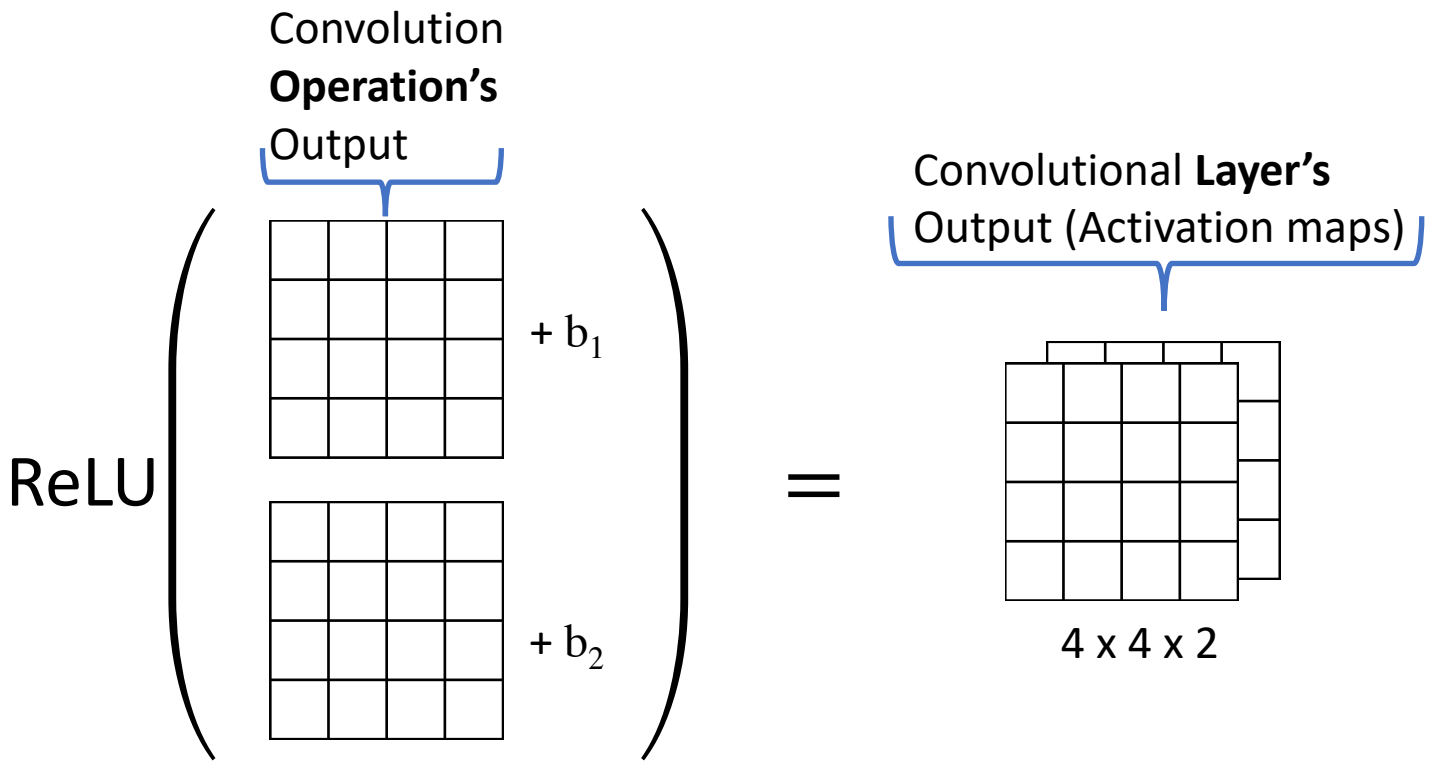
Number of filters

Number of filters

Multiple filters



A Convolutional Layer of CNN (ConvNet)



Convolutional Layer Output: Activation_map = ReLU ($(RGBImage * filter) + b$)

Output of a neuron in a FC NN: a = ReLU ($\mathbf{w}^{\mathrm{T}}\mathbf{x} + b$) in FC NN

Similar notation! (but not equal)

Input – Output Dimensions for l^{th} Convolutional Layer

Input (One image): $n_H^{[l-1]}$ x $n_W^{[l-1]}$ x $n_C^{[l-1]}$ ⟶ Output: $n_H^{[l]}$ x $n_W^{[l]}$ x $n_C^{[l]}$

Padding size: $p^{[l]}$ x $p^{[l]}$

Stride size: $s^{[l]}$ x $s^{[l]}$

Filter size: $f^{[l]} \times f^{[l]} \times n_C^{[l-1]} \times n_C^{[l]} = One\_Filter_{Dims} \times n_C^{[l]}$

(Number of Weights = Filter size), Bias size: $n_C^{[l]}$

Output dims (for one image) : $\left\lfloor \frac{n_H^{[l-1]} + 2p^{[l]} - f^{[l]}}{s^{[l]}} + 1 \right\rfloor \times \left\lfloor \frac{n_W^{[l-1]} + 2p^{[l]} - f^{[l]}}{s^{[l]}} + 1 \right\rfloor \times n_C^{[l]}$

$n_H^{[l]}$ x $n_W^{[l]}$ x $n_C^{[l]}$

The output dimensions for m input samples $A^{[l]}$: m x $n_H^{[l]}$ x $n_W^{[l]}$ x $n_C^{[l]}$

Pop Quiz

- How many parameters do we have in a conv layer with 10 filters that are 3x3x20 dimensional each?

- For one filter: we have 3x3x20 = 180 filter weights + 1 bias = **181** parameters.
- For all 10 filters: we have **181** x 10 = **1810 parameters** to learn for that layer!

Pop Quiz

- Imagine that you are designing a CNN with 5 layers. The first 4 layers are convolutional and the last layer is FC layer with one neuron.
  - The input dims are: 600x600x3.
  - In each of the 4 conv. layers:
    - We have 10 filters (for each, f = 3)
    - Stride is 2
    - Padding is “valid”.

What is the dims of the output at the end of the 5^{th} layer?

30 seconds to return your answers! ☺

Common Layer Types in a ConvNet

- Convolutional Layer (CONV)
- Fully Connected (FC, Dense)
- Locally Connected (not so commonly used!)

These three layers have parameters to be learned!

- Pooling (POOL)
- Activation Layer
  - (Sometimes, activation function is considered as a separate layer)

…

No learned parameters for these layers!

We have already seen both CONV and FC layers!

For now, we will use only those two layer types mentioned above.

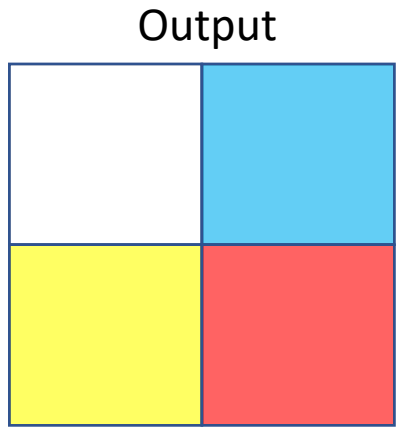
Pooling layer: Max pooling

Input

1	3	2	1
2	9	1	1
1	3	2	3
5	6	1	2

Filter size: f =2

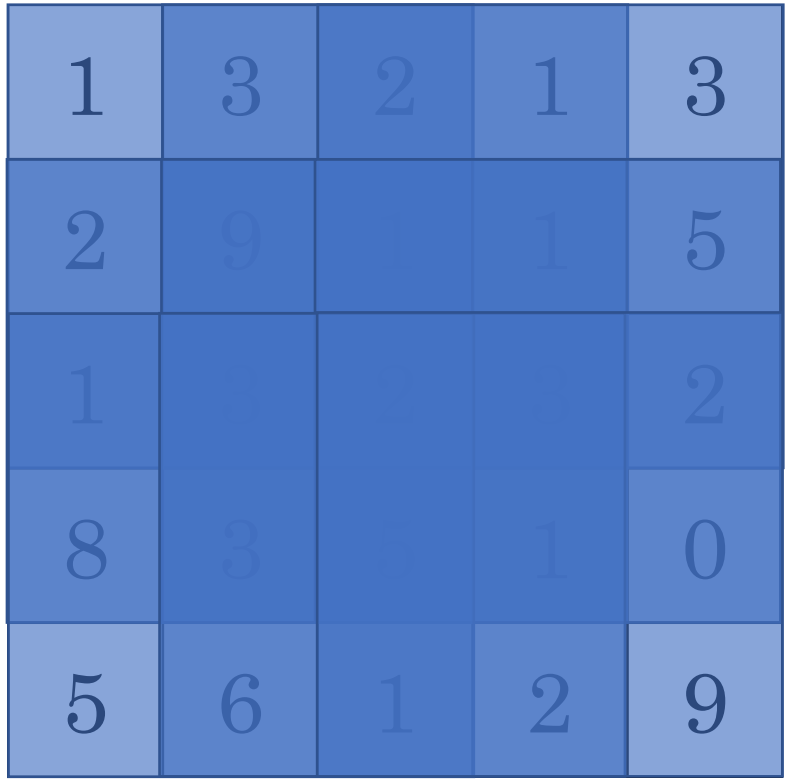
Stride size: s=2



Pooling is typically applied on each channel separately.

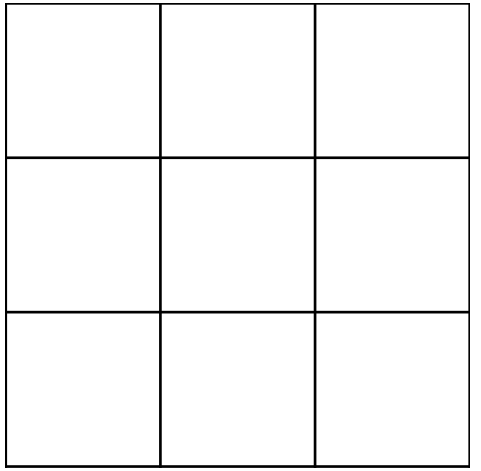
Pooling layer: Max pooling

Input

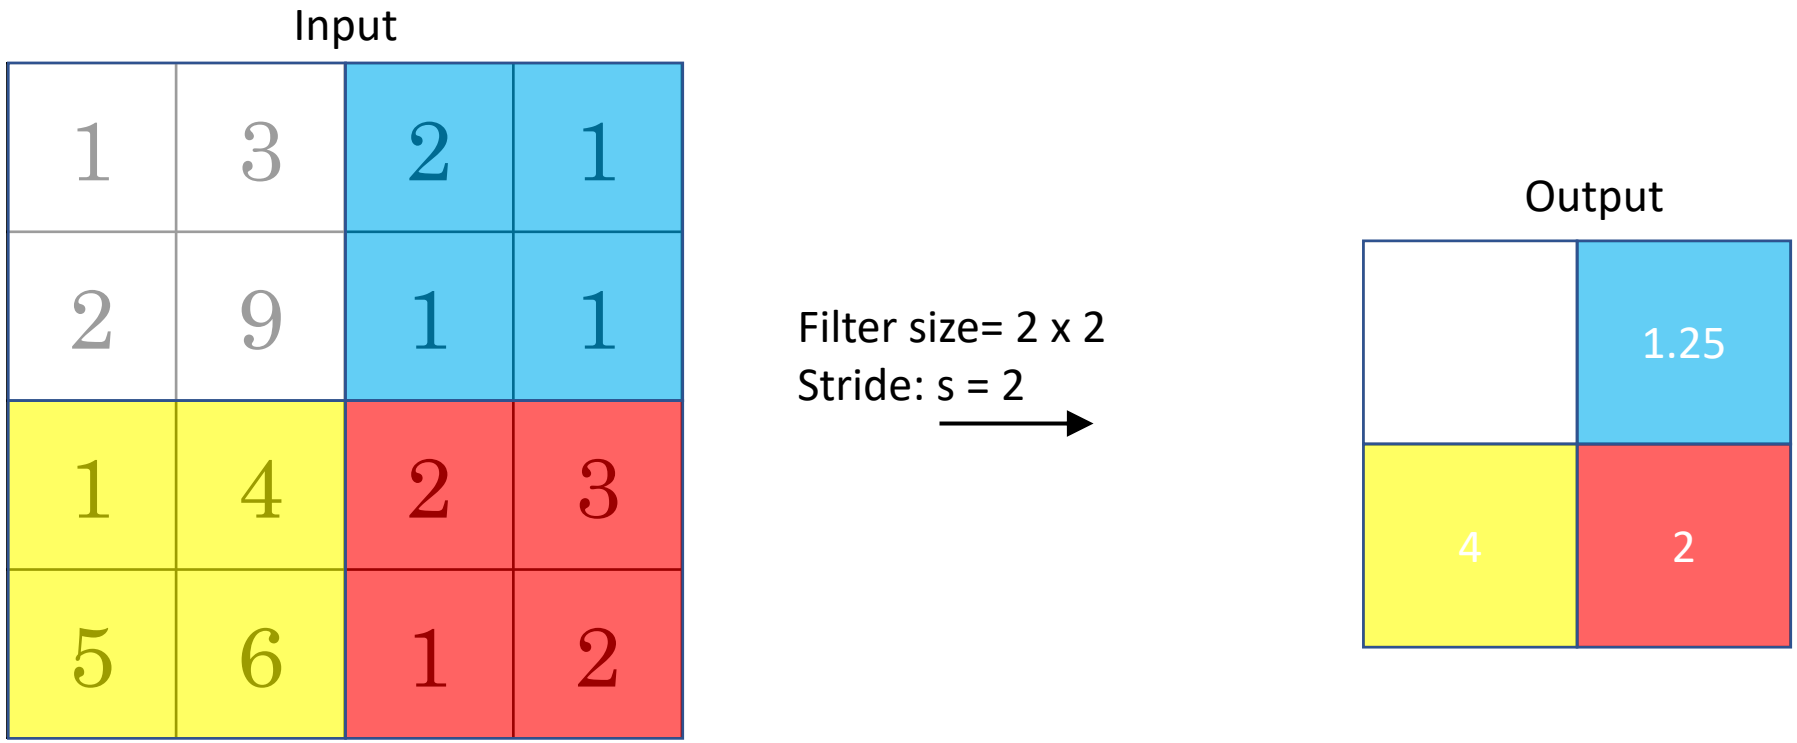


f=3
s=1

Output

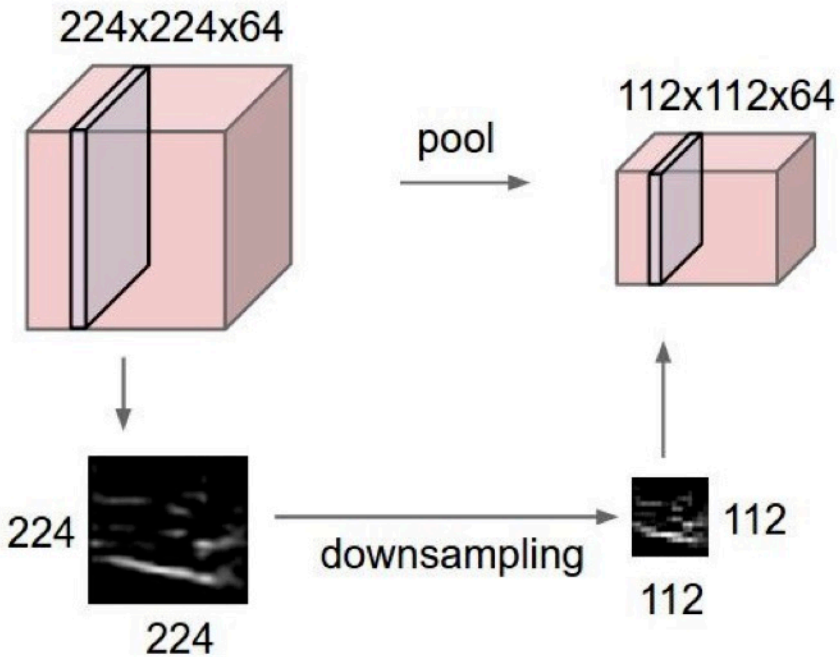


Pooling layer: Average pooling



Pooling layer

- makes the representations smaller and more manageable
- operates over each activation map independently:



Source: Fei-Feli Li & Justin Johnson & Serena Yeung

Summary of pooling

Hyperparameters:

f : filter size

s : stride

Max or **Average** pooling

f=2, s=2

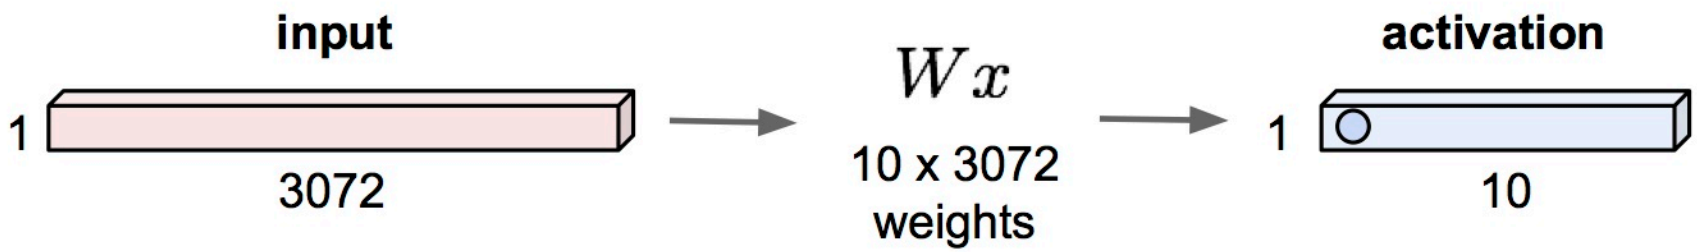
f=3, s=2

p = 0

Input: n_H x n_W x n_C Output: $\left\lfloor \frac{n_H - f}{s} + 1 \right\rfloor \times \left\lfloor \frac{n_W - f}{s} + 1 \right\rfloor \times n_C$

Fully Connected Layer

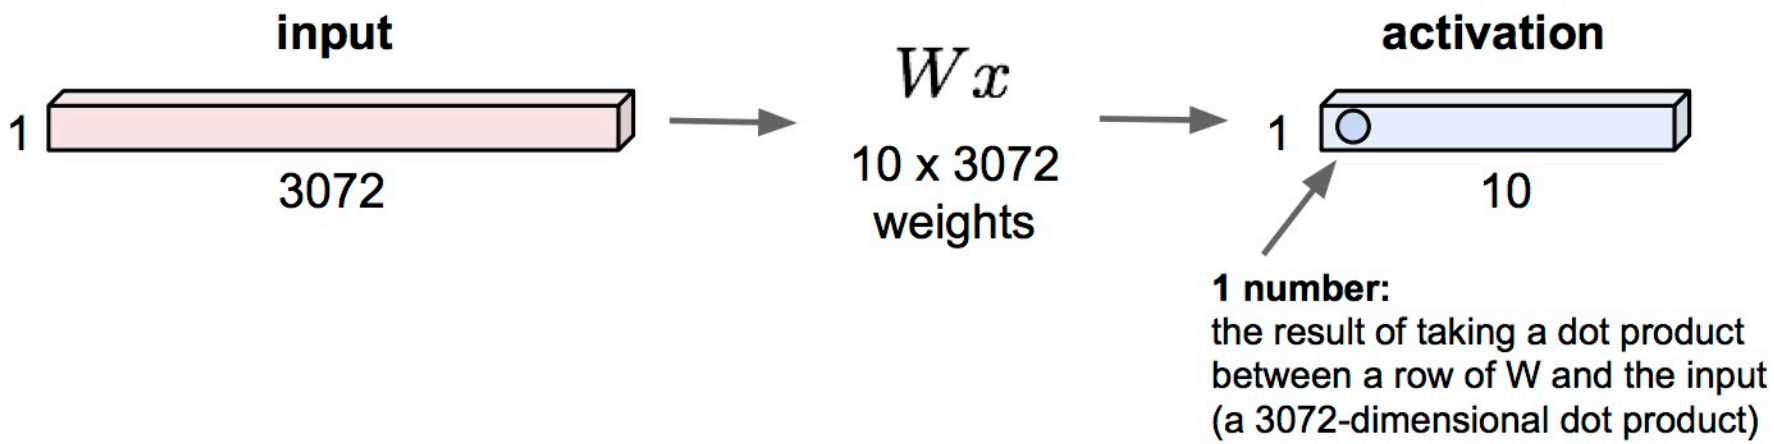
32x32x3 image -> stretch to 3072 x 1



Source: Fei-Feli Li & Justin Johnson & Serena Yeung

Fully Connected Layer

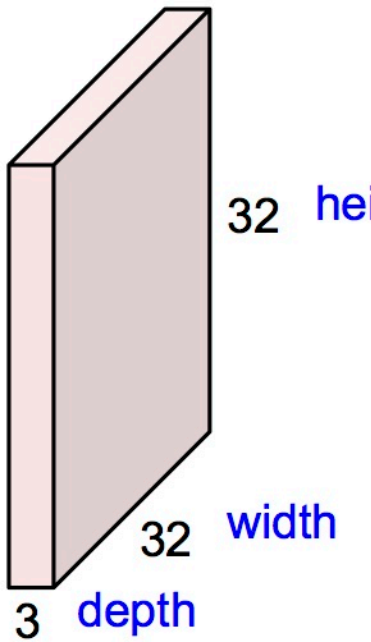
32x32x3 image -> stretch to 3072 x 1



Source: Fei-Feli Li & Justin Johnson & Serena Yeung

Convolution Layer

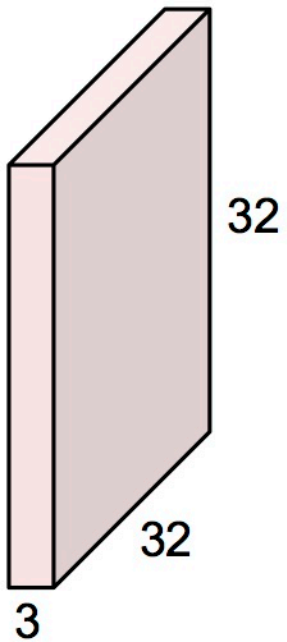
32x32x3 image -> preserve spatial structure



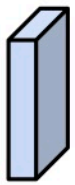
Source: Fei-Feli Li & Justin Johnson & Serena Yeung

Convolution Layer

32x32x3 image



5x5x3 filter



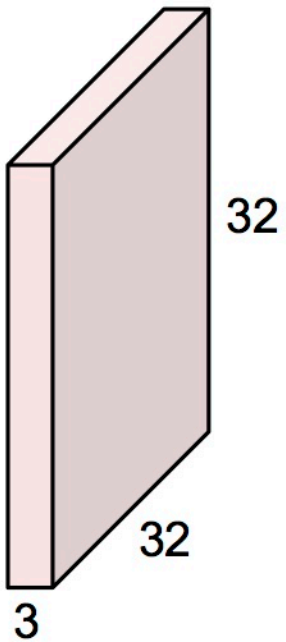
Convolve the filter with the image
i.e. “slide over the image spatially,
computing dot products”

Source: Fei-Feli Li & Justin Johnson & Serena Yeung

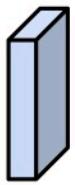
Convolution Layer

Filters always extend the full depth of the input volume

32x32x3 image



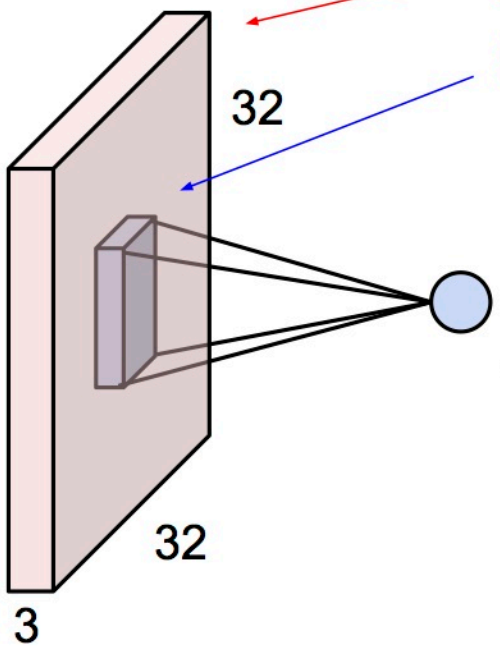
5x5x3 filter



Convolve the filter with the image i.e. “slide over the image spatially, computing dot products”

Source: Fei-Feli Li & Justin Johnson & Serena Yeung

Convolution Layer

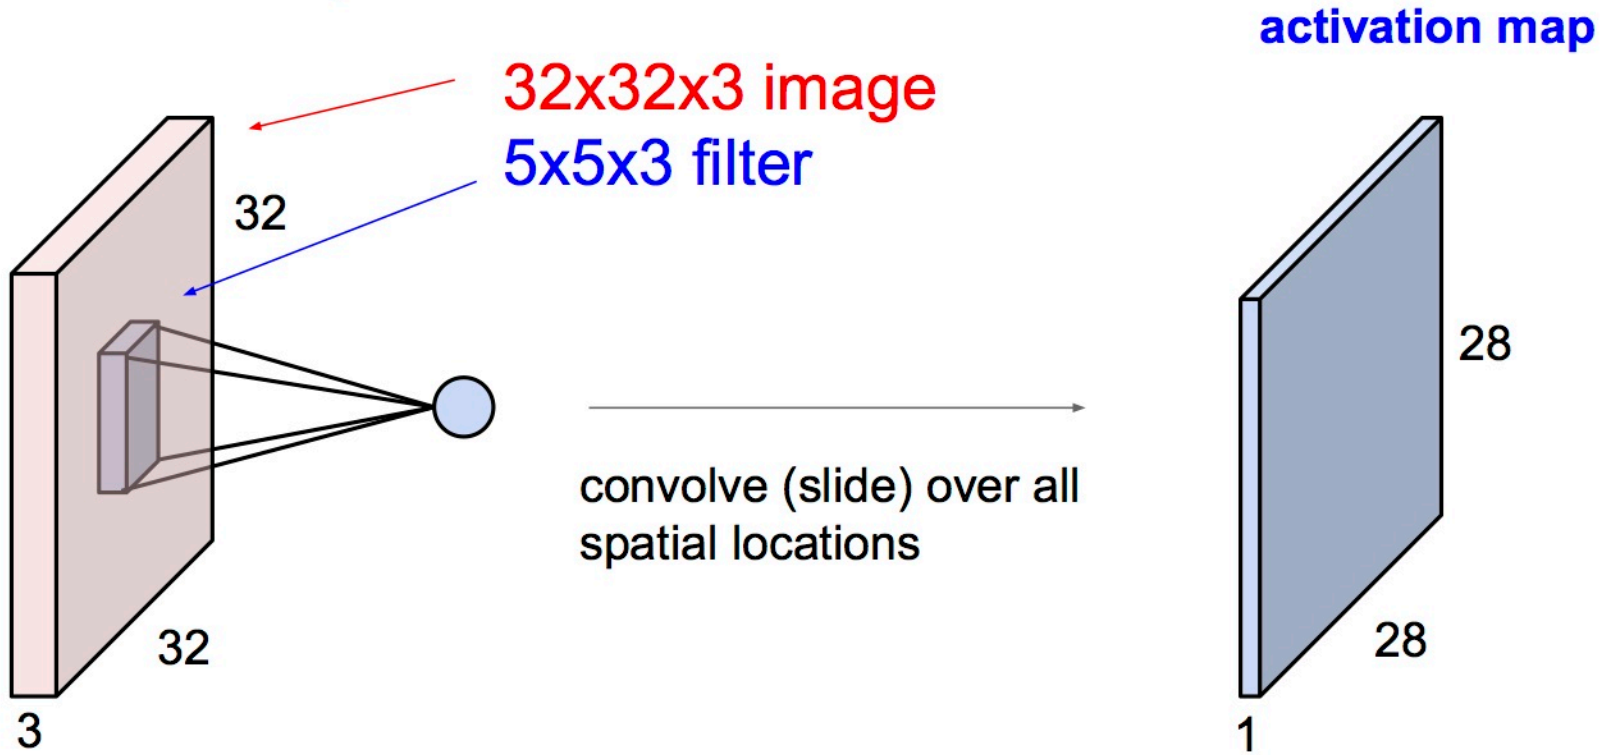


1 number:
the result of taking a dot product between the filter and a small 5x5x3 chunk of the image
(i.e. 5*5*3 = 75-dimensional dot product + bias)

$$w^T x + b$$

Source: Fei-Feli Li & Justin Johnson & Serena Yeung

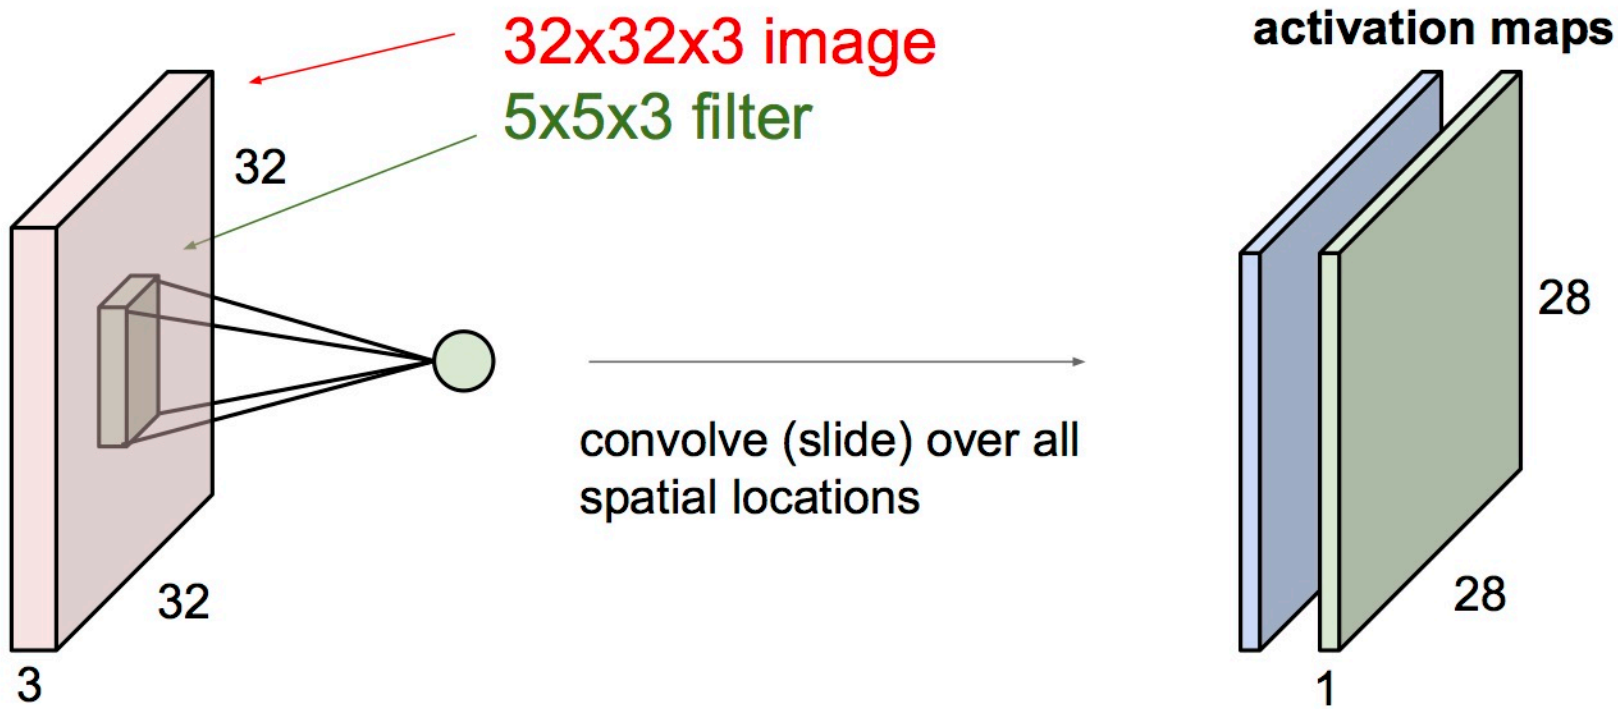
Convolution Layer



Source: Fei-Feli Li & Justin Johnson & Serena Yeung

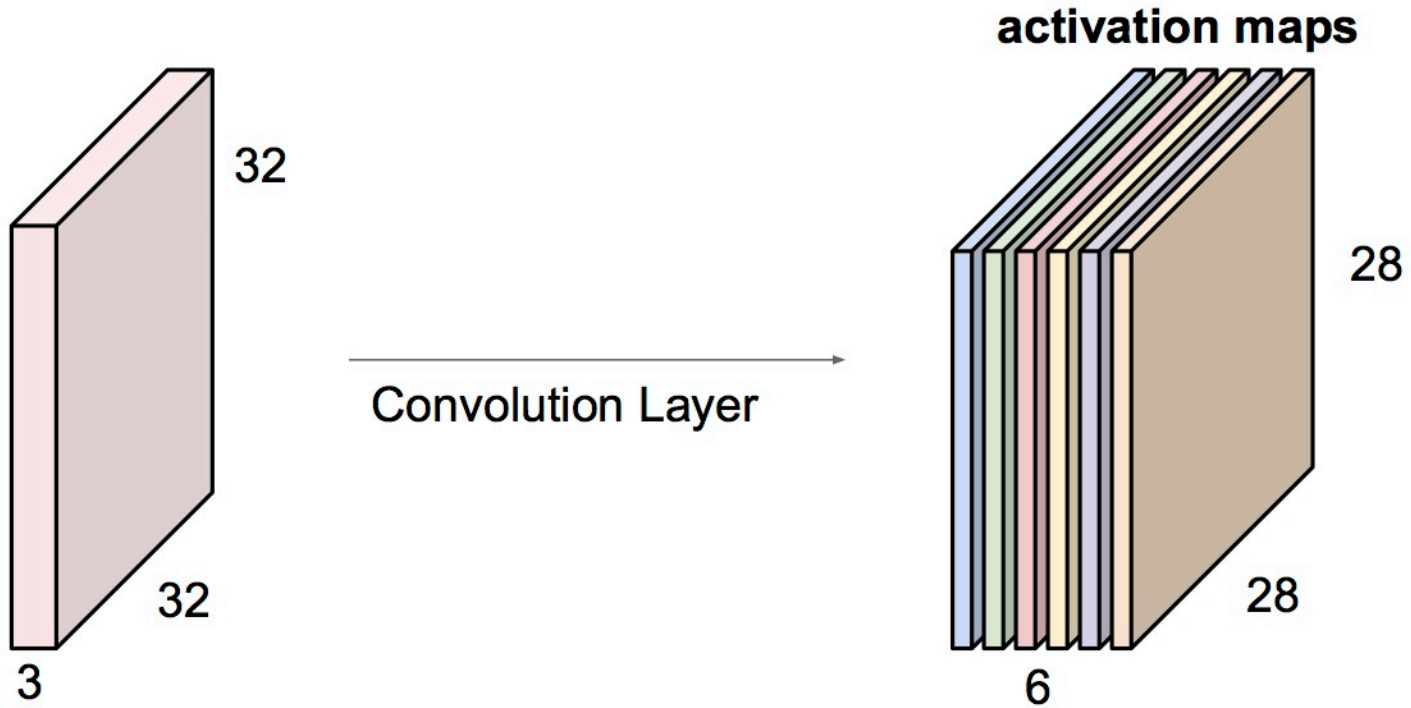
Convolution Layer

consider a second, green filter



Source: Fei-Feli Li & Justin Johnson & Serena Yeung

For example, if we had 6 5x5 filters, we'll get 6 separate activation maps:



We stack these up to get a "new image" of size 28x28x6!

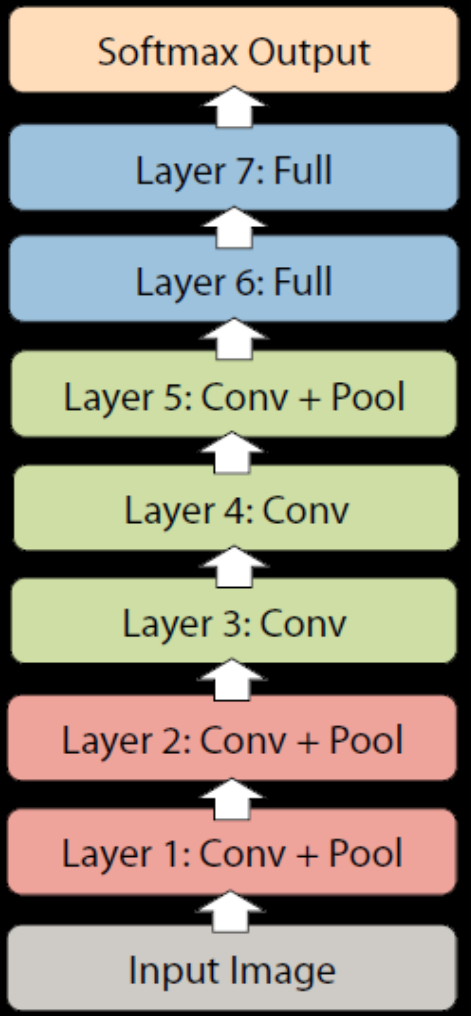
[LeCun et al., 1998. Gradient-based learning applied to document recognition]

(Modified) LeNet-5

	Activation shape	Activation Size	# parameters
Input:	(32,32,3)	3,072	0

Why ConvNet should be Deep?

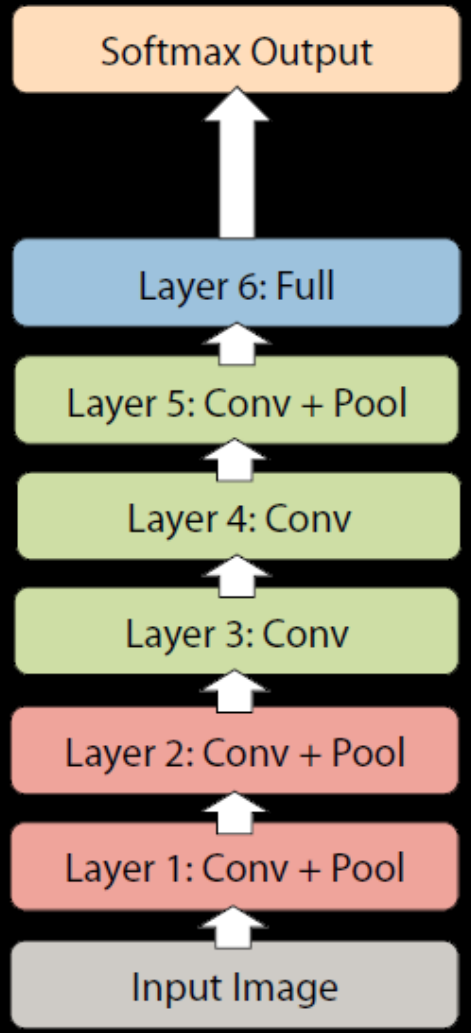
- 8 layers total
- Trained on Imagenet dataset [Deng et al. CVPR'09]
- 18.2% top-5 error
- Our reimplementation:
  18.1% top-5 error



Rob Fergus, NIPS 2013

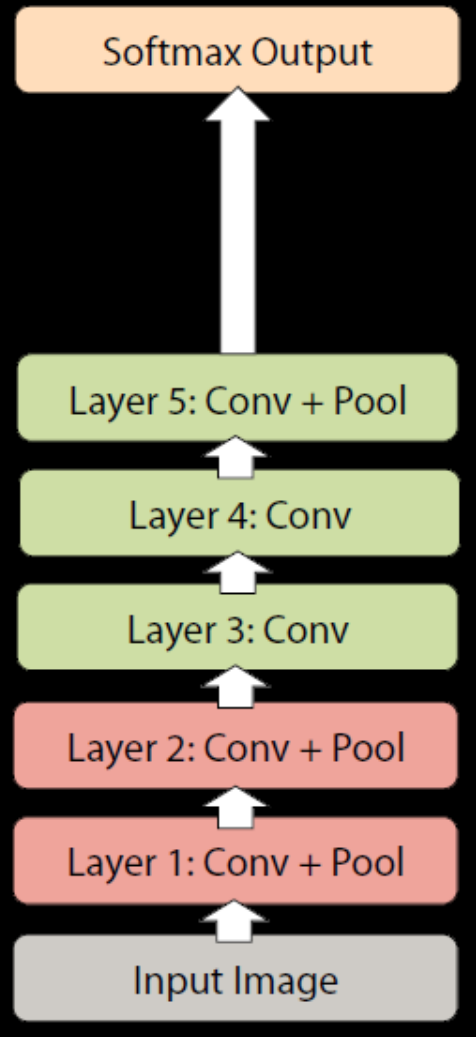
Why ConvNet should be Deep?

- Remove top fully connected layer
  - Layer 7
- Drop 16 million parameters
- Only 1.1% drop in performance!



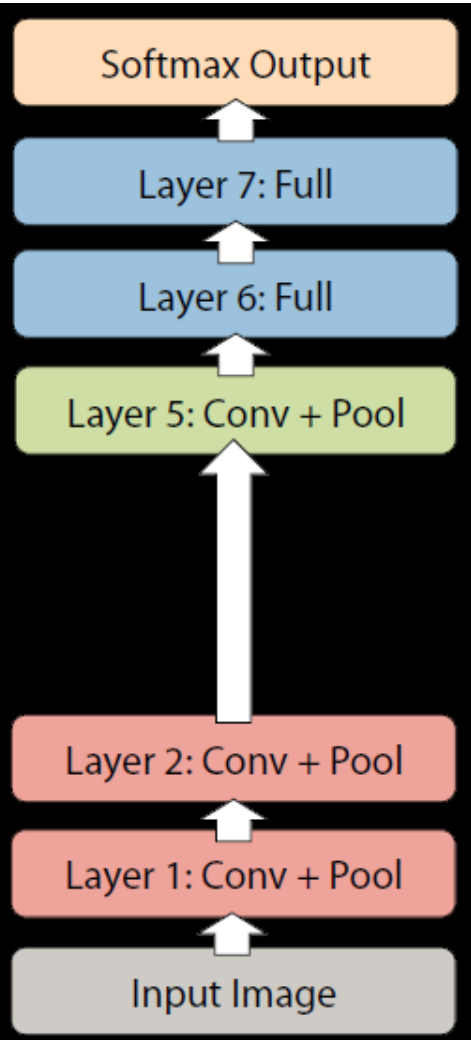
Why ConvNet should be Deep?

- Remove both fully connected layers
  - Layer 6 & 7
- Drop ~50 million parameters
- 5.7% drop in performance



Why ConvNet should be Deep?

- Now try removing upper feature extractor layers:
  - Layers 3 & 4
- Drop ~1 million parameters
- 3.0% drop in performance



Why ConvNet should be Deep?

- Now try removing upper feature extractor layers & fully connected:
  - Layers 3, 4, 6 ,7
- Now only 4 layers
- 33.5% drop in performance

→Depth of network is key

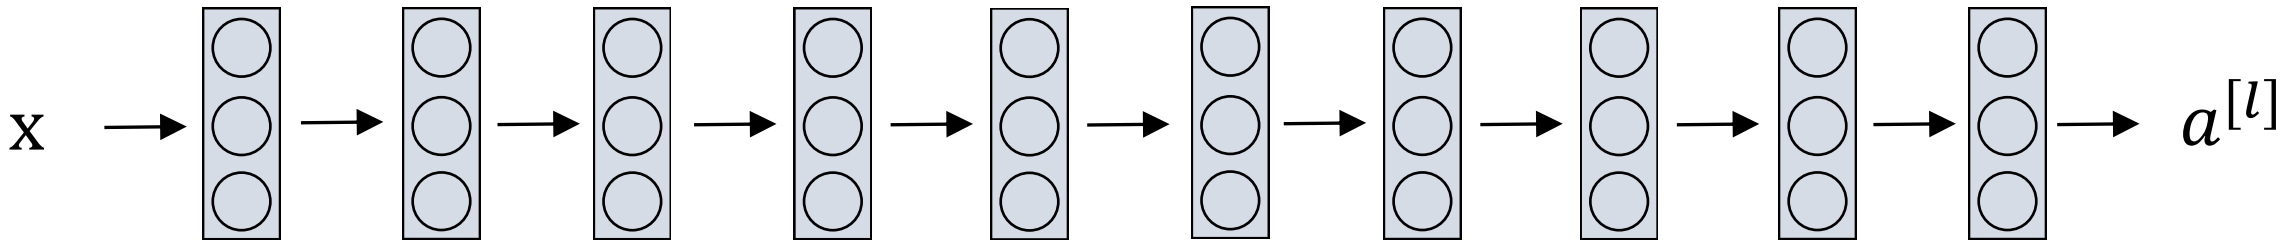
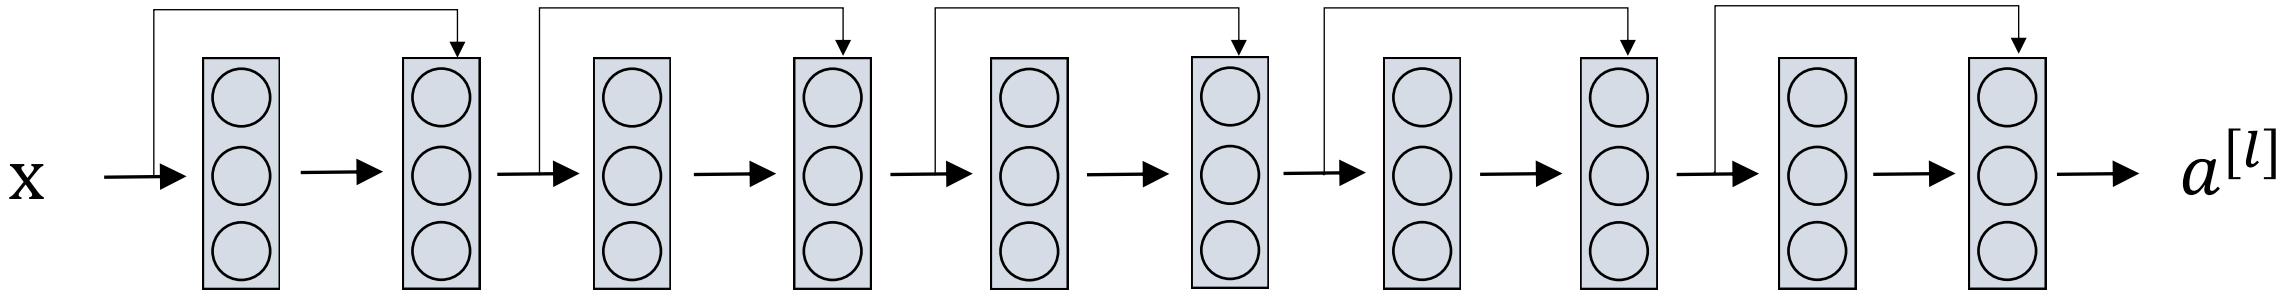
Residual Network



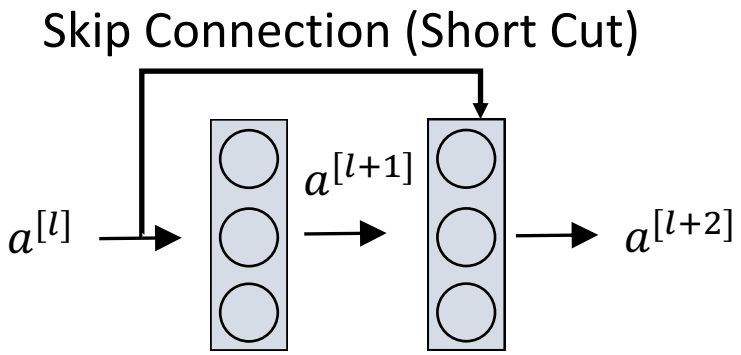
A “plain” (deep) network

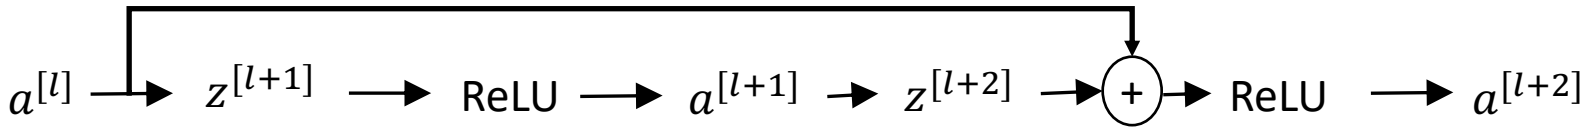


A residual network (with 5 residual blocks)

[He et al., 2015. Deep residual networks for image recognition]

Residual Building Block





$$z^{[l+1]} = W^{[l+1]}\, a^{[l]} + b^{[l+1]} \qquad a^{[l+1]} = g(z^{[l+1]}) \qquad z^{[l+2]} = W^{[l+2]} a^{[l+1]} + b^{[l+2]} \qquad a^{[l+2]} = g(z^{[l+2]})$$

With skip connection: $a^{[l+2]} = g(z^{[l+2]} + a^{[l]})$

[He et al., 2015. Deep residual networks for image recognition]
